

Solar power systems

Clean energy is the future!

Sun provides energy for own need or for electrical network.

Solar power system improves comfortability in leisure time living and saves money on energy costs regardless of the price fluctuation in electrical stock markets. Solar power system provides clean energy free from carbon footprint making it possible to be energy self-sufficient at the same time.

Product packages divided among energy consumption fulfil all basic needs.

Leisure time living

- 100W-500W adjuster-charger system for battery
- 500W-2000W single-phase inverter system attached to electrical network

Comfortable living at home

- 2KW-6KW single-phase inverter system attached to electrical network
- 8KW-10KW three- phase inverter system attached to electrical network

Solar power is especially economical way to produce energy for heat pumps when they are used for cooling down premises at summer time.

Customised solutions can be executed when ever needed. Our system engineering department's electric- and automation know-how is at your service and integration to different factory systems has been taken in to consideration. All project solutions are based on high-quality and trustworthy components.

Sleep with peace of mind without carbon footprint!
